

# 08\_06 Calling Custom Tags

In this exercise, you will use the `front.cfm` custom tag created in the previous video on all the remaining pages of the site. On each of the remaining page, you will use the `<cfmodule>` tag to apply the `customTags/front.cfm` custom tag. Use a customized meaningful title on each page.

The pages to be changed are

- `comePlayWithUs.cfm`
- `contactUs.cfm`
- `director.cfm`
- `history.cfm`
- `news.cfm`
- `profile.cfm`
- `siteMap.cfm`
- `wePlayForYou.cfm`

## General steps to follow

1. Open the file to update.
2. Delete all code starting from the `<!DOCTYPE>` down to the line right before `<div id="pageBody">`.

### WARNING

Some of these files have additional CFML code before the `<!DOCTYPE >` line. Do not delete this CFML code as it powers all the dynamic features of the site that you have developed in the previous chapters of the course.

3. Replace the deleted code by an opening `<cfmodule>` tag.
4. Use the `'template'` attribute of the `<cfmodule>` tag to call the `'customTags/front.cfm'`.
5. Provide a meaningful `'title'` attribute to the `<cfmodule>` tag.
6. Scroll down to the end of the code and delete the last lines of code starting from `<div id="footer">`.
7. Replace those lines by an ending `</cfmodule>` tag.
8. Save and run your updated page. Confirms it displays properly in the browser before moving on to the next file.
9. Repeat steps 1-8 for the remaining files.

When all the pages are updated and tested, confirm that the site's main navigation bar is working as expected throughout the entire site.
