04_05 Outputting Database content

In this exercise, you will create the dynamic version of some of the remaining pages of the HD Street band website.
The general procedure is as follows :

1. Rename the page by changing the `.html` file extension to `.cfm.`
1. Delete the content of `<div id="pageBody">` tag.
2. At the top of the page, create a `<cfquery>` tag block and write the proper SQL query. The only thing that changes from page to page is the value of the 'fld_pageID' field in the `WHERE` clause.
3. Create a `<cfoutput>` tag block in the (now empty) `<div id="pageBody">.`
4. Output the content of 'rsPage' in the `<cfoutput>` tag block.

To further help you, follow the guidelines in the following table.

Original name	Final name	Page ID	Notes
history.html	history.cfm	2	
wePlayForYou.html	wePlayForYou.cfm	3	
comePlayWithUs.html	comePlayWithUs.cfm	4	Do NOT delete all the content of `<div id="pageBody">` but the content of `<div id="calendarContent">` instead (More or less between lines 39 and 62).
siteMap.html	siteMap.cfm	5	
contactUs.html	contactUs.cfm	6	

IMPORTANT NOTES :
- It is critical that you test each page when you are done. Testing your work at each step will help you track down the issues as they arise.
- Because you changed the name of these files, the links in the main link bar will not work anymore. This issue is nothing to worry about right now, as it will be taken care of later in the course.
